#### Abstract

Number Theory is almost four thousand years old. In ancient clay tablet in Babylon, integral solutions of Pythagorean equations were listed down. Pythagoras theorem has always fascinated young and old mind alike. More than four hundred proofs of the Pythagoras theorem have been discovered so far. Pythagoras theorem is applied in almost every sphere of science- from geometry to Einstein's theory of relativity. New Pythagorean triangles are being discovered which satisfy certain constraints. Integral solutions of Diophantine equations related to Pythagorean equation are sought by many mathematicians. Applications of these triangles are also being explored in various fields of knowledge. In this paper, we have found nineteen extraordinary Pythagorean Triangles where their sum of two legs are dodecic numbers. These triangles are found by solving the dodecic Diophantine equation using the software Mathematica. Some interesting properties of these Pythagorean Triangles are also observed. Their applications can be explored in cryptography.

Keywords: Euclidean formula; Opposite Parity; Primitive Pythagorean Triangle; Dodecic

## 1. Introduction

The search for special Pythagorean Triangles continues till today. Darbari et al. [1] have discovered special Pythagorean Triangles with sum of their two legs as undecic. Darbari et al. [2] have found methods to use these Pythagorean Triangles in cryptography. Darbari and Darbari [3] have found out special Pythagorean Triangles in connection with Harshad numbers while Darbari and Darbari [4] have found exceptional Pythagorean Triangles with their perimeter as sum of three squares with two sides consecutive.

An attempt has been made to find special Pythagorean Triangles with sum of its two legs as a number which is a twelfth power of a number, i.e., is a dodecic.

## 2. Definitions

### 2.1. Dodecic

A number is called a dodecic if it is twelfth power of some number.

### 2.1.1. Pythagorean Equation

A quadratic equation

[^0]$$
X^{2}+Y^{2}=Z^{2}
$$
is called Pythagorean equation [5] after the famous mathematician and philosopher Pythagoras. It still remains as one of the most important equations of the world in all times.

### 2.1.2. Pythagorean Triangle [6]

A right angled triangle with sides $X, Y$ and $Z$ is called Pythagorean Triangle if $X, Y$ and $Z$ are positive integers. $X$ and $Y$ are called its legs and $Z$ is called its hypotenuse. Pythagorean triangles satisfy Pythagorean equation $X^{2}+Y^{2}=Z^{2}$.

If $X, Y$ and $Z$ satisfy Pythagorean equation and $a$ is positive integer, then $a X, a Y$ and $a Z$ also satisfy it. Therefore, one Pythagorean Triangle can generate infinite Pythagorean triangles.

### 2.1.3. Primitive Pythagorean Triangle

A Pythagorean Triangle is said to be primitive if $X, Y$ and $Z$ are co-primes, i.e., their greatest common divisor is one. Or, in other words, $\operatorname{GCD}(X, Y, Z)=1$.

### 2.2. Opposite Parity

Two natural numbers $m$ and $n$ are called of opposite parity if one of them is even and other is odd, i.e., $m \neq n(\bmod 2)$.

### 2.2.1. Euclidean Formula [7]

The positive primitive solutions of Pythagorean Equation with $Y$ even are

$$
X=m^{2}-n^{2}, Y=2 m n, Z=m^{2}+n^{2}
$$

where $m$ and $n$ are arbitrary integers of opposite parity with $m>n>0$ and $(m, n)=1$.

## 3. Method of Analysis

In the Pythagorean mathematics, primitive solutions of the Pythagorean Equation

$$
\mathrm{X}^{2}+\mathrm{Y}^{2}=\mathrm{Z}^{2}(1)
$$

is given by 2.6

$$
\mathrm{X}=m^{2}-n^{2}, \mathrm{Y}=2 m n, \mathrm{Z}=m^{2}+n^{2}(2)
$$

where $m, n \in \operatorname{I}$ such that $m>n>0$ and $(m, n)=1$ with one of them is odd other even.

### 3.1. Sum of two legs is a power of twelve, that is, dodecic

If X and Y are two legs of a right angled triangle and Z is the hypotenuse, then

$$
\begin{gathered}
\mathrm{X}+\mathrm{Y}=\beta^{12}(3) \\
\Rightarrow m^{2}-n^{2}+2 m n=\beta^{12}(4)
\end{gathered}
$$

Solving this equation using the software Mathematica, the twelve solutions of (4) are given by
$\beta=\left(m^{2}-n^{2}+2 m n\right)^{1 / 12}, \beta=-\left(m^{2}-n^{2}+2 m n\right)^{1 / 12}, \beta=-i\left(m^{2}-n^{2}+2 m n\right)^{1 / 12}$,
$\beta=\mathrm{i}\left(m^{2}-n^{2}+2 m n\right)^{1 / 12}, \beta=-(-1)^{1 / 6}\left(m^{2}-n^{2}+2 m n\right)^{1 / 12}, \beta=(-1)^{1 / 6}\left(m^{2}-n^{2}+2 m n\right)^{1 / 12}$,
$\beta=-(-1)^{1 / 3}\left(m^{2}-n^{2}+2 m n\right)^{1 / 12}, \beta=(-1)^{1 / 3}\left(m^{2}-n^{2}+2 m n\right)^{1 / 12}, \beta=-(-1)^{2 / 3}\left(m^{2}-n^{2}+2 m n\right)^{1 / 12}$,
$\beta=(-1)^{2 / 3}\left(m^{2}-n^{2}+2 m n\right)^{1 / 12}, \beta=-(-1)^{5 / 6}\left(m^{2}-n^{2}+2 m n\right)^{1 / 12}, \beta=(-1)^{5 / 6}\left(m^{2}-n^{2}+2 m n\right)^{1 / 12}$.
Solving the integral solutions, using Mathematica, using the command

Find Instance $\left[m^{2}-n^{2}+2 m n-\beta^{12}==0 \& \& \mathrm{n}<\mathrm{m} \& \& 0<\mathrm{m}<10^{15} \& \& 0<\mathrm{n}<10^{15} \& \& 0<\beta<10^{11} \& \& \mathrm{GCD}[\mathrm{m}, \mathrm{n}]==1,\{\mathrm{~m}, \mathrm{n}, \beta\}\right.$, Integers,10000], we get only 19 solutions. They are as follows:

From equation (2), hypotenuse is $\mathrm{Z}=m^{2}+n^{2}$ and from equation (3),
$X+Y=\beta^{12}$
Therefore, perimeter is given by
$\mathrm{X}+\mathrm{Y}+\mathrm{Z}=\beta^{12}+m^{2}+n^{2}$
Substituting the values of $m, n$ from Table 1, we find the values of $\mathrm{X}, \mathrm{Y}$ and Z from equation (2); $\mathrm{X}=m^{2}-n^{2}, \mathrm{Y}=2 m n$,
$\mathrm{Z}=m^{2}+n^{2}$
The following table verifies that the perimeter is a sum of two squares and a dodecic,
Table $3 \mathrm{X}+\mathrm{Y}+\mathrm{Z}=\beta^{12}+\mathrm{m}^{2}+\mathrm{n}^{2}$

## 4. Results and discussion

We observe that

- The value 119 of $\beta$ is repeated once.
- Except for 49 and repeated value 119 , which are multiple of 7 , rest other values of $\beta$ are prime numbers.
- $2 \mathrm{~m}^{2}+\mathrm{mn}=0(\bmod 2)$
- $4 m^{2}+2 m n=0(\bmod 4)$
- $3 \mathrm{~m}^{2}+\mathrm{mn}+\mathrm{n}^{2}=0(\bmod 3)$
- $\quad m+n+\beta=0(\bmod 4)$ or $2(\bmod 4)$
- $3 m+5 n+\beta=0(\bmod 2)$
- $6 \mathrm{~m}^{3}+3 \mathrm{n}^{3}+\Phi(\beta)=0(\bmod 6)$ or $4(\bmod 6)$
- $\mathrm{m}^{2}+\mathrm{n}^{2}+\{\Phi(\beta)\}^{2}=1(\bmod 4)$
- $\mathrm{m}^{3}+\mathrm{n}^{3}+\{\Phi(\beta)\}^{3}=1(\bmod 4)$
- $\mathrm{m}^{4}+\mathrm{n}^{4}+\{\Phi(\beta)\}^{4}=1(\bmod 4)$
- $\quad \mathrm{X}+\mathrm{Y}+\mathrm{Z}=0(\bmod 2)$
- $2 \mathrm{X}+\mathrm{Y}+\mathrm{Z}=0(\bmod 3)$
- $\quad \mathrm{X}+2 \mathrm{Y}+3 \mathrm{Z}=0(\bmod 4)$
- $(\mathrm{Y}+\mathrm{Z}-\mathrm{X})^{2}=2(\mathrm{Y}+\mathrm{Z})(\mathrm{Z}-\mathrm{X})$
- $\quad(\mathrm{X}+2 \mathrm{Y}+\mathrm{Z})^{2}=(\mathrm{Z}-\mathrm{X})^{2}+4(\mathrm{X}+\mathrm{Y})(\mathrm{Y}+\mathrm{Z})$
- $\mathrm{X}+2 \mathrm{Y}+\mathrm{Z} \pm 2\{(\mathrm{X}+\mathrm{Y})(\mathrm{Z}-\mathrm{Y})\}^{1 / 2}=0(\bmod 16)$ or $=0(\bmod 4)$

## 5. Conclusion

In conclusion, one may endeavor to discover Pythagorean Triangle which satisfy the conditions similar to that presented in the above problem.

## Compliance with ethical standards

## Disclosure of conflict of interest

No conflict of interest to disclosed.
